Thermostatic Mixing Valve

Model Number: 570
Size: 3/8” (10 mm) Compression

**Description**
The 570 3/8” (10 mm) compression fitting thermostatic mixing valves maintain and limit hot water to a desired selectable temperature between 80°F and 120°F (27°C and 49°C), with flow rates as low as 0.5 gpm (1.9 LPM). The superior flow characteristics of these valves provide accurate temperature control (+/-3°F) with low pressure drop. As an added feature, the 570 incorporates dual check valves to protect against cross-flow and integral screens to filter out debris.

**Applications**
A thermostatic mixing valve is intended for under-sink installation to control the hot water temperature and prevent accidental scalding. The water temperature must be adjusted by the installer using a thermometer to measure the hot water temperature at the faucet outlet. Maximum temperature of 110°F (43°C) is recommended.

**Application Note**
Delivery of water to fixtures intended for hand washing should always be controlled by valves listed to ASSE 1070. Thermostatic valves provide the user with both thermal shock and scald protection. These valves should always be adjusted after installation to the desired temperature.

**Pressure – Temperature**
- Minimum Supply Pressure: 30 psi (207 kPa)
- Hot Inlet Temperature: 120°F – 180°F (49°C – 82°C)
- Cold Inlet Temperature: 40°F – 85°F (4°C – 29°C)
- Temperature Differential: 20°F (−7°C)
- Temperature Out: 80°F – 120°F (27°C – 49°C)
- Factory Setting: 100.4°F
- Maximum Pressure: 125 psi (10.3 bar)

The pressure differential must be less than 20% between the hot and cold inlet supplies.

**Installation Instructions**
The 570 installs easily onto most faucets. When installing this thermostatic mixing valve, be sure to follow all local plumbing codes for your application.
1. Shut off the supply valves and remove any existing piping between the supply valves and the faucet.
2. Connect the 570 to the supply valves and the faucet. Typical connections are shown in Figures 2 and 3 below.
3. Turn on the supply valves.
4. Follow the instructions on page 2 of this manual, Temperature Adjustment, to obtain the desired outlet water temperature.

**Note 1:** When using copper tubing, do not extend the tubing more than 3/16” beyond the compression ferrule. When installing with non-rigid supply hose connections, anchor the 570 thermostatic valve to the wall using the provided spacer to prevent any unintentional movement.

**Note 2:** Do not use pipe dope/paste on valve thread connections.

**Multiple Sensor Faucets:**

TAG-570 REV. A – 12/13
**Temperature Adjustment**

1. Loosen the cap screw until the handle turns freely (do not remove the screw) with a 3mm (7/64”) hex wrench.
2. As a safety feature the cap must be partially lifted from the valve to adjust temperature.
3. With the faucet turned on and in the full hot position, adjust the setting of the valve to obtain the desired outlet water temperature. Turn clockwise to decrease temperature.
4. Lower handle and tighten screw.
5. Check outlet temperature.

**Note 1:** The hot water should be allowed to flow for two or three minutes prior to adjusting the valve setting in order to have the hottest inlet temperature flowing through the valve.

**Note 2:** If handle locator becomes separated from stem, align black mark on cartridge stem with groove on knob locator and reassemble as shown in Detail “A.”

**ATTENTION INSTALLER:** After installation, please leave this Instruction Sheet for occupant’s information.

**IMPORTANT:** Inquire with governing authorities for local installation requirements.
